Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

## ALIGNMENTS

Site-specific recombination; bacterial attachment site; plasmid; vaccine; gene therapy; ss. A new expression cassette consists of a gene of interest controlled by a promoter and terminator functional in mammalian cells and is flanked by sequences in direct orientation which allow site-specific recombination. Lambda attp and attB sites specific recombination are the bacteriophage phage lambda. The expression cassettes can be used for producing plasmids which are useful in vaccination or for genetic/ cellular therapy, e.g. of amyotrophic lateral sclerosis; diseases of Plasmids capable of site-specific recombination - useful for vaccination and in gene therapy. coagulation/dyslipoproteinaemia or viral infections (AIDS or hepatitis) Wils P; Sequence 21 BP; 4 A; 4 C; 2 G; 11 T; 0 U; 0 Other; Scherman D, Darquet A, Claim 17; Page 43; 81pp; French. The invention describes producing a collection of responder cells for high throughput screening assays, by identifying and cloning regulatory regions into expression constructs to control nucleic acids, and introducing the constructs into addressable cells. The method is useful introducing the constructs into addressable cells. The method is useful introducing cells used in high throughput screening assays for profiling substances and conditions and for studying the function of the regulatory tender the effects of any perturbation, such as external or internal condition, on the cells from which the regulatory regions in the reporter gene constructs are derived can be inferred. This sequence represents a constructs of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Chromosome-based platform; artificial chromosome; eukaryotic chromosome; att site; integrase; recombinase; ACes; gene therapy; transgenic animal; platform artificial chromosome expression system; PCR primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention describes a novel sequence-specific recombination (SSR) of DNA in a eukaryotic cell, comprising introducing two DNA sequences (I, II) into a cell, using an integrase (Int) to effect SSR. The invention also describes (I) a mucleic acid comprising a 243 base pair sequence (III), fully defined in the specification, or its derivatives; and (2) vector containing (III), or its derivatives, plus a therapeutic gene, or its derivatives. The method is particularly used in somatic gene therapy in humans and animals, but can be applied more generally for gene transfer to animal or plant cells. The method is simple and controllable, and provides stable and targeted integration of selected DNA sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence-specific recombination of DNA in eukaryotes, useful particularly for somatic cell gene therapy, uses an integrase to effect recombination between att sites.

The present invention describes a eukaryotic chromosome (I) comprising one or several att sites, where an att site is heterologous to the Chromosome, and permits site-directed integration in the presence of lambda-integrase. Also described: (I) a platform artificial chromosome expression system (Aces) (II) comprising several sites that participate in recombinase catalysed recombination; and (2) a method (MI) for introducing a heterologous nucleic acid into a platform artificial chromosome. (I) can be used in gene therapy. (MI) is useful for introducing a heterologous nucleic acid molecule into a platform artificial chromosome, preferably an ACes. (II) is useful for producing a ratificial chromosome, preferably an ACes. (II) is useful for producing continual (e.g. a fish, insect, reptile, amphibian, arachnid, or mammal) by introducing (II) by cell fusion, lipid-mediated transfection, micropiccille bombardment or direct DNA transfer into an embryonic cell, preferably a stem cell or an embryo. (II) comprises a heterologous nucleic acid that encodes a therapeutic product which is useful for an incleic acid that encodes a therapeutic product which is useful for an enterproper action of the production of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  making a library of ACes comprising random portions of a genome. ACC44612 to ACC44732 and ABP96650 to ABP96657 represent sequences used in the
                                                                                                                                                                                                                                                                                                                                                                                    Novel eukaryotic chromosome comprising one or many att sites which permits site-directed integration in the presence of lambda-integrase, useful for site-specific recombination-directed integration of DNA of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           100.0%; Score 21; DB 7; Length 21; 100.0%; Pred. The invention relates to novel methods for cloning or subcloning one or more nucleic acid molecules (NAMs) comprising: (a) combining in vitro or in vivo: (1) at least one insert donor molecules (IDMs) comprising one or more desired nucleic acid segments flanked by at least 2 recombination contains of the segments flanked by at least 2 recombination or contains of the segments of the set 2 recombination sites which do not recombine with each other; (2) one or more vector of recombination proteins; (b) incubating the combination to transfer one or more of the desired segments into one or more of the VDMs, thereby producing one or more desired product molecules (PMs). The methods can be used for the efficient and specific recombination of NAM segments. They desired characteristics and/or nucleic acid segments. The methods can also be used for changing vectors. The oligonucleotides AAX78935-X78994 are used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Recombination efficiency with mutated attB2 site oligonucleotide attB0.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Bacteriophage lambda; att; recombination site; attB; attB; attL; attL; mutant; recombinational cloning; entry vector; destination vector; gene product targeting; fusion tag cleavage; PCR primer; ss.

The present invention describes isolated nucleic acid molecules (I) encoding an attB1, attB2, attP1, attP2, attL1, attL2, attR1, and attB2 concoling an attB1, attB2, attP1, attB2, attL1, attB2, attR1, and attB2 concoling an attB2 consprising one or more att recombination sites comprising at least one mutation in its core region that increases the specificity of interaction between the recombination sites one provided att recombination sites, and (2) an isolated nucleic acid molecule (III) comprising one or more mutated att recombination sites or myzising at least one mutated att recombination site and a second nucleic acid molecule comprising a second recombination site and a second nucleic acid molecule comprising a second recombination site that interacts with the mutated att recombination site. (1), (III), primers, vectors and methods from the present invention are used for the recombinational cloning of nucleic acid molecules. They can be used for changing vectors, targeting desired proteins, operably linking nucleic acid molecules of interest to regulatory genetic sequences, constructing genes for fusion tags from changing copy number, changing replicons, cloning into phages and changing copy number, changing replicons, cloning into phages and choose the process of the present sequence is used in the communities.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
Isolated nucleic acid molecules encoding an attB1, attB2, attB1, attL1, attL2, attL1, and attR2 nucleotide sequence useful for the recombinational cloning of polypeptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      primer attB0 used to produce a population of hybrid DNA molecules.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Bacteriophage lambda; recombination; att site; PCR primer; lambda Int;

                                                                                                                                                             nucleic acid sequences, and PCR primers of the invention. The att sequences are recognised by the recombination protein lambda integrase (Int). The invention is a new method of producing a population of hybrid nucleic acids comprising mixing at least a first population of hybrid acids comprising one or more recombination sites with at least one target nucleic acid comprising one or more recombination sites with at least one target nucleic acids the nucleic acids to recombine with all or some of the rarget nucleic acids. The method is useful for producing a population of hybrid nucleic acids which may be the same or different. The nucleic acids may be used to express therapeutic proteins or peptides and they may also be used to express therapeutic proteins or peptides and they may also be used to create novel fusion proteins by expressing different sequences linked to each other. The method allows simultaneous cloning of two or more different nucleic acids
                           Producing hybrid nucleic acids, useful for expressing novel therapeutic polypeptides, by mixing the same or different nucleic acids having one or more recombination sites in the presence of recombination proteins, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Isolated nucleic acid molecules comprising a DNA segment having two engineered recombination sites, derived from att or lox, which flank a selectable marker and comprise a core region having an engineered

Comprising a first nucleic acid sequence having a defined sequence (IAAC87866 to AAC87881, sequences complementary to AAC87866 to AAC87881, or an RNA sequence corresponding to AAC87866 to AAC87881, are: (1) an isolated nucleic acid molecule (II) comprising a first mutated recombination site that removes one or more stop codons from the recombination site; (2) an isolated nucleic acid molecule (III) comprising a first at the recombination site; (2) an isolated nucleic acid molecule (III) comprising a first att recombination site comprising a mutation that enhances recombination specificity; (3) vectors (IV) comprising the above mentioned nucleic acids; and (4) cells comprising the above mentioned nucleic acids or (IV). The nucleic acids are used in engineering a core region of a given recombination site to provide mutative sites suitable for subcloning reactions. The use of nucleic acids for obtaining consineered recombination in vitro or in vivo makes the methods for DNA or RNA subcloning, highly specific, rapid, and less labour intensive. The present sequence represents an E. coli atts oligonuclectide, which is used in an example from the present invention
present invention describes an isolated nucleic acid molecule (I)

The present invention relates to a method for in vitro cloning of a nucleic acid of interest. The method involves mixing in vitro two vectors each comprising at least one recombination site and the nucleic acid of interest; incubating the mixture in the presence of at least one recombination protein to result in recombination of the recombination sites, leading to production of a chimeric nucleic acid molecule comprising the nucleic acid of interest; contacting hosts with the mixture, and selecting for a host comprising the chimeric nucleic acid molecule, and selecting against a host comprising the vectors comprising the second vector; to clone the nucleic acid. The present sequence is a recombinantion site, which may be used in the method of the present In vitro cloning of nucleic acid involves mixing vectors comprising recombination sites and/or nucleic acid, incubating mixture to produce chimeric molecule, contacting hosts with mixture and selecting host. The invention relates to a method for apposing an expression signal and a gene or partial gene, using recombinatorial cloning. The method incubates nucleic acids comprising the expression signal and the gene/ partial gene in the presence of a recombination protein under conditions sufficient to cause recombination and therefore appose the expression signal and the gene or partial gene using recombinatorial cloning. The methods are useful for apposing an expression signal and a gene or partial gene using recombinatorial cloning. The methods are also useful for changing vectors, constructing genes for fusion proteins, changing copy number, changing replicons, cloning into phages, and cloning e.g., PCR products (with an attB site at one end and a loxe site at the other end), genomic DNAs. The methods are highly specific, rapid, and less labour intensive than prior art methods. The present sequence is a recombination site useful for recombination
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Methods for apposing nucleic acids comprising an expression signal and a gene/partial gene, using recombinatorial cloning by incubating the nucleic acids in the presence of a recombination protein under conditions for recombination.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to a method for in vitro cloning of a nucleic acid of interest. The method involves mixing in vitro two vectors each comprising at least one recombination site and the nucleic acid of interest; incubating the mixture in the presence of at least one recombination protein to result in recombination of the recombination sites, leading to production of a chimeric nucleic acid molecule comprising the nucleic acid of interest; contacting hosts with the mixture; and selecting for a host comprising the chimeric nucleic acid molecule, and selecting against a host comprising the vectors comprising the second vector, to clone the nucleic acid. The present sequence is a PCR primer used in the method of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             In vitro cloning of nucleic acid involves mixing vectors comprising recombination sites and/or nucleic acid, incubating mixture to produce chimeric molecule, contacting hosts with mixture and selecting host.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      0
                                                                                                                                                                                                                                                                                                                                         The invention relates to a vector donor DNA molecule comprising a first DNA segment and a second DNA segment containing at least one selectable marker. The first and second segments are separated either by, in a clircular vector donor, a first and a second recombination site, or in a linear vector donor, at least a first recombination site, where each pair of flanking recombination sites are engineered and do not recombine with each other. The nucleic acid molecule, vectors and methods are useful for moving or exchanging segments of DNA molecules using engineered moving or exchanging segments of DNA molecules using engineered molecules that have the desired characteristic(s) and/or DNA segment(s).
                                                                                                                                                                                                                                             New Vector Donor DNA molecule for recombinational cloning using engineered recombination sites, comprises first and second DNA segments that do not recombine with each other and that contain a Selectable

The invention relates to a vector donor DNA molecule comprising a first DNA segment and a second DNA segment containing at least one selectable marker. The first and second segments are separated either by, in a circular vector donor, a first and a second recombination site, or in a linear vector donor, at least a first recombination site, where each pair of flanking recombination sites are engineered and do not recombine with each other. The nucleic acid molecule, vectors and methods are useful for moving or exchanging segments of DNA molecules using engineered
                                                                                                                                                                                                                                                                               segments
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           recombination sites and recombination proteins to provide chimeric DNA molecules that have the desired characteristic(s) and/or DNA segment(s). The present sequence represents the engineered recombination site
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                          New Vector Donor DNA molecule for recombinational cloning using engineered recombination sites, comprises first and second DNA segmethat do not recombine with each other and that contain a Selectable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Making Cointegrate DNA molecule, by combining recombination sites flanking the desired DNA segment in insert donor DNA, with the recombination sites of vector donor DNA, using site specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 32,

Patent No. 5607646

GENERAL INFORMATION:
APPLICANT: Chanco, Kazuncri
APPLICANT: Kambara, Hideki
TITLE OF INVENTION: POLYNUCLEOTIDE CAPTURING TIP AND
TITLE OF INVENTION: POLYNUCLEOTIDE PREPARATIVE METHOD AND DETECTION
TITLE OF INVENTION: METHOD USING SAME
NUMBER OF SEQUENCES: 18
CORRESPONDENCE ADDRESS:
ADDRESSEE: Antonelli, Terry, Stout & Kraus
STREET: Suite 600, 1919 Pensylvania Ave., NW
CITY: Washington
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0; Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Length 201;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match 59.3%; Score 144; DB 1; Length 20 Best Local Similarity 100.0%; Pred.
